Summary

- Background in bank-scale fintech delivery (CMB RPA+AI platform, intelligent risk-control systems) provides strong grounding in correctness, observability, and production discipline.
- Transitioned from traditional finance technology toward AI-native products, Web3 systems, and independent building, with long-term interest in trading infrastructure and automated execution.

Education

UNSW Sydney / Master of Data Science

2024 - 2025

- Completed coursework in Spark-based large-scale data analysis, PostgreSQL internals, and Rust, strengthening data engineering and systems fundamentals.
- Delivered independent and collaborative projects in AI and Web3 alongside academic study.

Experience

China Merchants Bank / Information Technology Department / Chengdu

Backend Engineer / FinTech Systems Developer

2021 - 2023 | Chengdu

- Contributed deeply to the Hailuo RPA+AI platform, developing and shipping backend services on the bank's cloud-native platform to support hundreds of live automation scenarios in real operational workflows.
- Built data pipelines around Kafka ingestion, Elasticsearch analytics, and reporting APIs, powering operational dashboards and automated daily, weekly, and yearly reporting for product, business, and management teams.
- Independently delivered an intelligent post-loan transaction-screening workflow, handling business alignment, project setup, development, release, and iteration using XXL-JOB for large-scale concurrent processing under compliance constraints.

UNSW Sydney / Independent Builder

Data Science Student / AI & Web3 Builder

2024 - 2025 | Sydney, Australia

- Built ChronoStamp with classmates as a Web3 project, covering on-chain product design, wallet-connected flows, and decentralized application constraints.
- Delivered BizCover Automation as an independent commercial project, turning insurance quote and policy-pricing workflows into reusable browser automation infrastructure.

Projects

AI Knowledge Base

Tags: Python, FastAPI, RAG, PostgreSQL, pgvector, LLM (Minimax API)

- Built a RAG system with multi-knowledge-base routing, citation tracing, and observability, focused on accuracy and auditability in real financial-system usage.
- Added answer citations, source tracing, and prompt controls to make outputs auditable and trustworthy for serious use.

ChronoStamp

Tags: Hardhat, Next.js, Arbitrum, IPFS, Ethers.js, Solidity

- Built an on-chain credential protocol combining off-chain eligibility checks, on-chain issuance, and user interaction into a complete Web3 product loop.
- Used off-chain signature authorization with on-chain contract verification; abstracted credential issuance through a factory pattern enabling standardized deployment across multiple event scenarios.

Web3 Agent

Tags: TypeScript, Polygon, Agent, RPC, Automation

- Built an execution agent for on-chain tasks with emphasis on execution safety, state management, and full-process automation.
- Integrated event triggers and execution logs for visibility into multi-step on-chain workflows with deterministic guardrails around wallet actions.

Skills

Backend and Engineering

Spring Boot, FastAPI, MyBatis, Kafka, Elasticsearch, Redis, PostgreSQL, Docker, Linux

AI and Data

RAG, LLM Applications, Prompt Engineering, Spark, Claude Code, CodeX, Hermes Agent

Web3

Hardhat, Foundry, Ethers.js, Arbitrum, IPFS, Solidity, Polygon, Smart Contract Development

Frontend and Delivery

Next.js, Playwright, Tailwind CSS, Vite, React, Vercel, Supabase, Railway

Additional

- Recently graduated with a master's degree; available for full-time remote work or internships, five or more days per week.
- IELTS certified; able to read English technical documentation and conduct engineering research in English.
